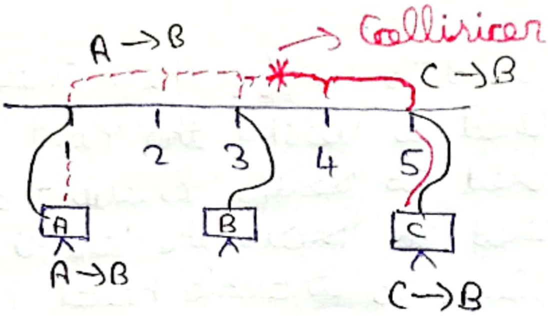
DEVICE TEST

SUREN NETWORK
PLAY WITH TECHNOLOGIES

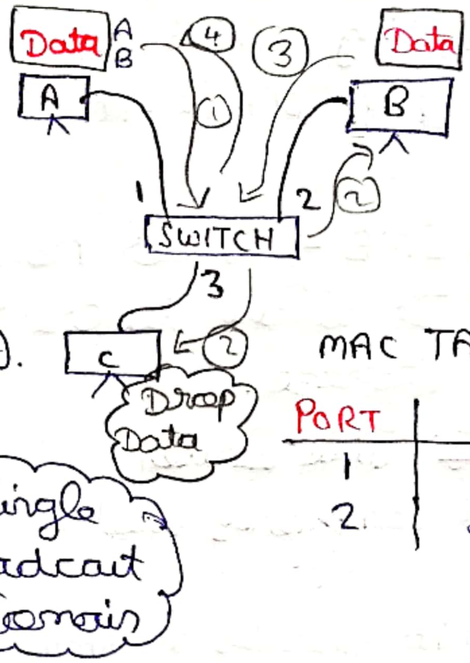
1, Explain behaviour of hub device



* Hub is a broadcast device.
* It produces heavy traffic.
* Collision occurrence is high.
* One-way Communication device.
* Layer 1 Device.

Eg: Walkie-Talkie

2, Explain behaviour of switch device



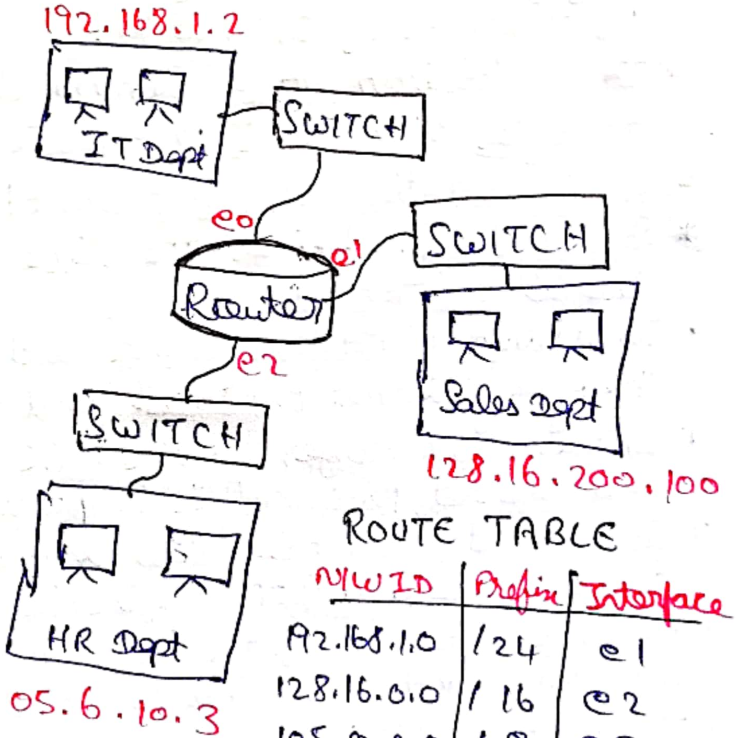
* Switch is a Layer 2 device.
* It uses a MAC table which stores the Sender Port and its MAC address.
* ~~This~~ If packet arrives, it checks the MAC table, if found the forwards it (Unicast).
* Else creates a broadcast and stores the port and MAC details in table.
* This technique is known as "Address Learning".

→ MAC table life time is 5 min.

MAC TABLE

PORT	MAC
1	A
2	B

3, Explain behaviour of router device



* It is a Layer 3 device.
* It is used to breakdown the Single broadcast domains.
* It maintain Routing Table and this is called Routing.
* Routing table N/W ID, Prefix and Interface.
* If a data packet is arrived it checks the routing table and forwards only to the respective IP.
* It is a Unicast device.

ROUTE TABLE

N/W ID	Prefix	Interface
192.168.1.0	/24	e1
128.16.0.0	/16	e2
105.0.0.0	/8	e3
